## IQ Performance Overview

IQ Performance, part of the DV Pinnacle solution, simplifies campaign delivery and optimization decisions by giving you the tools to make actionable campaign decisions and gain insights into your campaign performance.

This document contains the following sections:

- Key Concepts and Measures
- Viewability
- Fraud/SIVT
- Brand Safety
- Violations
- Geo
- Measuring for CTV Devices
- IVT Disclosures
- Benchmarks

IQ Performance consists of programs and performance views.

| Item             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Program          | <p>A <b>Program</b> is your collection of DV campaign data. On the Agency side, <b>IQ Performance</b> programs consolidate your DV data into an Advertiser or Line of Business (LOB) level, allowing you to see all of your data in a single location.</p> <p>On the Partner side, a <b>Program</b> shows you campaign performance across the entire Media Property for all of the DV advertisers with whom you are working.</p>                                                                                                                  |
| Performance View | <p>The <b>Performance View</b> drop-down menu lets you access the different performance views – there are four standard performance views:</p> <ul style="list-style-type: none"> <li>• <b>Summary:</b> The <b>Summary</b> view provides high-level analysis across the entire program. The <b>Details</b> tab provides performance rates for Advertisers, LOBs, Campaigns and Media Properties.</li> <li>• <b>Insights:</b> The <b>Insights</b> view provides a breakdown of performance for each of the DV dimensions (Agency only).</li> </ul> |

| Item | Description                                                                                                                                                                                                                                                                                                      |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | <ul style="list-style-type: none"><li>• <i>Actions (Display and Video)</i>: The <i>Actions</i> views highlight campaigns, sites and placements that need attention to help you make optimization decisions.</li><li>• <i>Disclosures</i>: The <i>Disclosures</i> view provides easily exportable data.</li></ul> |

## Description of methodology

The Description of Methodology (DOM) is a concise description of DV's processes including (but not limited to) a description of the techniques used, sampling procedures used, criteria for reporting incidents, and any omissions, errors or biases known to the service which may exert a significant effect on the findings shown in IQ Performance.

For a complete description of DV methodology, refer to the following document: [Description of Methodology](#).

## MRC-accredited solutions

DoubleVerify has been accredited by the Media Rating Council (MRC) for monitoring and blocking metrics within the following services: display & video viewability and impression counting, property-level ad verification and SIVT within Desktop, Mobile Web and In-App environments. Accreditation was first granted in 2013 with renewals in 2015, 2017, 2018 and 2020.

DoubleVerify undergoes thorough annual audits to review and re-accredit its MRC-accredited technologies. Methodologies and metrics released after the annual audit undergo informal discussions with the auditors to ensure they follow best practices and guidelines established by the IAB and MRC, but are not fully accredited until the next audit.

This means that an independent third party has audited the DoubleVerify technology, processes and results, and has confirmed the reliability and integrity of the system. As accreditation is for specific metrics by environment, there are some Pinnacle metrics and methodology that have not yet been accredited by the MRC. Metrics that have not yet been accredited are noted throughout this glossary using the endnote [3].

Additionally, there are metrics that are accredited only within specific environments, even though our current metric offering expands beyond the accredited set. The data within the following metrics is accredited for only the Desktop, Mobile Web and Mobile App environments.

- Total Calls
- Monitored Ads (formerly Monitored Impressions)
- Gross Impressions
- GIVT Ads (formerly GIVT Impressions)
- GIVT Other Impressions
- Net Impressions
- Total Net Impressions
- Authentic Ads (formerly Authentic Impressions)
- Increase in Authentic Rate
- Brand Safe Ads (formerly Brand Safe Impressions)
- Brand Safety Incidents
- Off App Inclusion List Incidents
- On App Exclusion List Incidents
- Fraud/SIVT Free Ads (formerly Fraud/SIVT Free Impressions)
- Fraud/SIVT Incidents

For a complete list of accredited metrics broken out by environment, please reach out to your DV Account Manager.

## Key Concepts and Measures

This section includes the following information:

- DV performance measures
- Request, ad and impression counts
- Ad/impression thresholds and rate filters
- Filters
- Why is N/A reported in my data?
- Why is falsified-website.com in my site-level report?

### DV performance measures

IQ Performance includes the introduction of several new quality measures that demonstrate the performance of your campaigns.

| Measure                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentic Ads®                 | <p>Ads served in a brand-specific, high-quality environment that meets the settings of your DV Digital IQ profile, improving the performance of your campaigns. This is a single, deduplicated measure of ads that were brand safe and free from fraud and other forms of Sophisticated Invalid Traffic (SIVT) in the targeted geographic region.</p> <p>The <b>Authentic Rate</b> is calculated with the following formula: <math>\text{Authentic Ads} / \text{Monitored Ads}</math>.<sup>1</sup></p>                                        |
| Authentic Viewable Impressions | <p>An <b>Authentic Viewable Impression</b> includes an additional premium layer of analysis that shows when an <b>Authentic Ad®</b> also meets the IAB standard for viewability. DV provides <b>Authentic Display Viewable Impressions</b> and <b>Authentic Video Viewable Impressions</b>, both of which meet the respective IAB viewability standard.</p> <p>The <b>Authentic Viewable Rate</b> is calculated with the following formula: <math>\text{Authentic Viewable Impressions} / \text{Measured Impressions}</math>.<sup>2</sup></p> |

| Measure                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentic Custom Viewable Impressions <sup>3</sup> | <p>An <b>Authentic Custom Viewable Impression</b> includes an additional premium layer of analysis that shows when an <b>Authentic Ad®</b> was also in view as determined using the <b>Custom Viewability Measurement</b> definition for the profile.</p> <p>The <b>Authentic Custom Viewable Rate</b> is calculated with the following formula: <b>Authentic Custom Viewable Impressions/Measured Impressions</b>.<sup>2</sup></p>                                                                                              |
| Unique Incidents                                   | <p>The deduplicated count of all incidents found when ads in your campaign <i>did not</i> meet the criteria of your <b>DV Digital IQ</b> profile. This single, deduplicated measure is one that you may want to use to request makegoods, as it represents all ads that did not meet your insertion order criteria for fraud and SIVT protection, brand safety and geographic targeting.</p> <p>The <b>Unique Incident Rate</b> is calculated with the following formula: <b>Unique Incidents/Monitored Ads</b>.<sup>1</sup></p> |
| Fraud/SIVT Free Ads                                | <p>The unique count of ads free from bot fraud, site fraud, nonhuman data center traffic, hijacked devices and injected ads.</p> <p>The <b>Fraud/SIVT Free Rate</b> is calculated with the following formula: <b>Fraud-SIVT Free Ads/Monitored Ads</b>.<sup>1</sup></p>                                                                                                                                                                                                                                                          |
| Brand Safe Ads                                     | <p>The unique count of ads that were not served on sites in violation of your site lists (either <b>Exclusion List</b> or <b>Inclusion List</b>) or sites with inappropriate content.</p> <p>The <b>Brand Safe Rate</b> is calculated with the following formula: <b>Brand Safe Ads/Monitored Ads</b>.<sup>1</sup> This formula applies only to campaigns using Brand Safety services.</p>                                                                                                                                       |
| In Geo Ads <sup>3</sup>                            | <p>The unique count of ads that were served within your targeted country, designated market areas (or media market areas outside of the US), state/region or zip code as defined by your <b>Geo Targeting</b> profile.</p> <p>The <b>In Geo Rate</b> is calculated with the following formula: <b>In Geo Ads/Monitored Ads</b>.<sup>1</sup></p>                                                                                                                                                                                  |

## Request, ad and impression counts

IQ Performance includes counts for total requests, blocked requests and monitored ads.

| Measure                          | Description                                                                                                                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Evaluations <sup>3</sup>         | The total number of non-GIVT video ad calls that Video Filtering assessed.                                                                                                                                          |
| Filters <sup>3</sup>             | The number of Evaluations that were determined to be non-compliant based on your Brand Safety, Geo, or Fraud profiles. This number reflects the amount of ad calls that were “filtered”.                            |
| Filter Rate <sup>3</sup>         | The ratio between Filters and Evaluations, for example, 1% of evaluations were “filtered”.                                                                                                                          |
| Allowed Evaluations <sup>3</sup> | The number of Evaluations that were determined to be compliant based on your Brand Safety, Geo, or Fraud profiles.                                                                                                  |
| Requests                         | The count of requests received by the blocking tag when the Blocking service is used.                                                                                                                               |
| Blocked Requests                 | The unique count of requests that were blocked because they did not meet the blocking criteria for your DV Digital IQ campaign. This is a single, deduplicated measure of all incidents prevented through blocking. |
| Allowed Ads                      | A unique count of requests that were allowed because they met the blocking criteria for your DV Digital IQ campaign and had no violations.                                                                          |
| Monitored Ads                    | The total count of ads served where the DV Monitoring services were applied.                                                                                                                                        |

## Ad/impression thresholds and rate filters

IQ Performance programs use the following general threshold for ads and impressions. This applies to all views. Ads and impressions for domains and subdomains with low volumes of traffic are aggregated into a single line item and displayed as follows:

- **Low-traffic domains** are an aggregated grouping of domains/subdomains (i.e., Delivery Sites) that received less than 1,000 Monitored Ads per day.

**Note:** The Low-traffic domains grouping is not used on sites with a site-based violation (Brand Safety or Site Fraud). These sites are displayed down to sites with a single ad.

- **Low-traffic subdomains** are an aggregated grouping of subdomains within a single domain that received less than 1,000 ads per day.
- **Low-traffic Zip Codes, DMAs or MMAs, or States** are an aggregated grouping of zip codes, DMAs or MMAs, or states per day per placement with counts below the following criteria:
  - Monitoring: Aggregation takes effect if there are less than 1,000 **In Geo Ads** and less than 10 **Out of Geo Incidents**.
  - Blocking: Aggregation takes effect if there are less than 100 **In Geo Requests**.

**Note:** The low-traffic geo labels are Low-traffic Zip Codes, Low-traffic DMAs/MMAs, and Low-traffic States/Regions.

## Rolled up placement

Individual placement names are available for up to 120 days. After 120 days, any *Placement Name* level data is aggregated or “rolled up” into one record within the reporting project. This logic only applies at the *Placement Name* level.

## Actions filtering

On the *Actions* views, the tables are filtered using both incident rates and ad thresholds to highlight items that need attention or will provide the most optimization impact.

- **Ad Threshold:** All tables and headlines are filtered to items with at least 1,000 Monitored Ads per reporting period (i.e., the date range or other attributes selected in the filters). This helps target optimization actions towards the areas where performance improvement will have the most impact.

- **Incident Rates:** The *Actions* views are filtered using thresholds to show areas with a high level of incidents or low viewability. The following filters are applied to both the *Optimization Opportunities* tables and the more granular *Incident* tables:
  - 15% Blocking (10% for Partner programs)
  - 70% Not Viewable Rate
  - 5% Brand Safety and Fraud/SIVT Incident Rates
  - 7% Out of Geo Incident Rate

Note: To see site-based violations data down to a single impression, generate a custom report in Report Builder.

## Filters

The filters that are available for all your IQ Performance views allow you to filter the data for date, campaign, media property, placement type, placement code and buying channel. There are also filters specific to particular views only.

The following table describes the filters that are available in IQ Performance.

| Filter           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Traffic Validity | <p>The <b>Traffic Validity</b> filter is available on all performance views. This filter highlights the impact of fraud and other forms of <b>SIVT</b> on viewability, and allows you to uncover the discrepancies in identifying <b>Fraud/SIVT</b> among vendors by allowing you to include or filter it out of the data. The options are:</p> <ul style="list-style-type: none"> <li>• All</li> <li>• Fraud/SIVT</li> <li>• Valid Traffic</li> </ul> |
| Media Type       | <p>The <b>Media Type</b> filter appears on all performance views, where applicable. It allows you to filter data to display, video, or all.</p> <p>Note: On views or tabs dedicated to a specific media type, i.e., a view or tab specifically dedicated to display or video, the filter is hard-coded to the corresponding media type.</p>                                                                                                            |

| Filter                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device Delivery Type     | <p>The <b>Device Delivery Type</b> filter appears on all performance views and allows you to filter data by one or more of these delivery types:</p> <ul style="list-style-type: none"> <li>• CTV</li> <li>• Desktop</li> <li>• Smartphone In-App</li> <li>• Smartphone Web</li> <li>• Tablet In-App</li> <li>• Tablet Web</li> <li>• Unknown/Other</li> </ul> <p><b>Note:</b> Viewability measurement is not supported on CTV Ads; however, the following services are supported:</p> <ul style="list-style-type: none"> <li>• Geo Target Avoidance</li> <li>• Brand Safety</li> <li>• Fraud (Site Fraud/IVT and App Fraud/IVT only)</li> </ul> |
| Creative (Display)       | <p>The <b>Creative</b> filter appears on the <b>Insights</b> performance view (<b>Display Viewability</b> and <b>Mobile In-App</b> tabs) and allows you to filter data by a specific creative or creatives, listed by ID.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Placement Size (Display) | <p>The <b>Placement Size</b> filter appears on the <b>Insights</b> performance view and allows you to filter data by a specific placement size or sizes:</p> <ul style="list-style-type: none"> <li>• Large Placements (&gt;605 x 165)</li> <li>• Leaderboard (85-95 x 723-733)</li> <li>• Medium Rectangle (245-255 x 295-305)</li> <li>• Small Placements (&lt;88 x 31)</li> <li>• Wide Skyscraper (595-605 x 155-165)</li> <li>• Unknown</li> </ul>                                                                                                                                                                                           |
| Player Size (Video)      | <p>The <b>Player Size</b> filter appears on the <b>Insights</b> performance view and allows you to filter data by a specific player size or sizes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Filter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mobile Operating System (Display and Video) | <p>The <b>Mobile Operating System</b> filter for both display and video appears on the <b>Mobile In-App</b> tab on the <b>Insights</b> view. It allows you to filter by one or more of these operating systems:</p> <ul style="list-style-type: none"> <li>• Android</li> <li>• iOS</li> <li>• Other</li> <li>• Unknown</li> </ul>                                                                                                                                                                                                                                                                                                                                                                            |
| Tracker Initiation Type                     | <p>The <b>Tracker Initiation Type</b> filter delineates server-initiated ads from other video traffic. This filter provides advertisers and partners with the ability to filter video traffic based on client side measurement, where DV received signals directly from the client, and server initiated ads, where the ad server fires its beacons on behalf of the client using the following dimension values:</p> <ul style="list-style-type: none"> <li>• Server Initiated Ads</li> <li>• Client Initiated Ads</li> <li>• Initiation Status Unknown</li> </ul> <p>The Track Initiation Type filter applies to <b>Monitoring</b> data only. <b>Blocking</b> data will have an "N/A - Blocking" value.</p> |
| Ad Render Status                            | <p>The <b>Ad Render Status</b> filter identifies server initiated versus client initiated and unknown traffic. This filter provides advertisers and partners with the ability to differentiate between rendered impressions and other ads that either could not be measured, or were not rendered, by filtering on the following dimension values:</p> <ul style="list-style-type: none"> <li>• Render Status Unknown</li> <li>• Began to Render</li> </ul> <p>The Ad Render Status filter applies to <b>Monitoring</b> data only. <b>Blocking</b> data will have an "N/A - Blocking" value.</p>                                                                                                              |
| Begin to Render Impression <sup>3</sup>     | <p>Ads where the MRC impression guidelines' count on begin to render requirements were determined to have been met.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Filter                                   | Description                                                                                                                             |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Render Status Unknown Ads <sup>3</sup>   | Ads measured using display image pixels where the MCR impression guidelines' count on begin to render requirements were not determined. |
| Client Initiated Ads <sup>3</sup>        | Ads where the DV tracker was fired either from the user's device or from the server on behalf of the user's device.                     |
| Server Initiated Ads <sup>3</sup>        | Ads where the DV tracker was fired directly from the server on its own.                                                                 |
| Initiation Type Unknown Ads <sup>3</sup> | Ads where the DV tracker's location of origin (from user device or server side) was not determined at the time of firing.               |

## Why is N/A reported in my data?

There are several situations where N/A will appear in your IQ Performance tables.

| Where N/A appears                            | Reason                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In the Delivery Site Column                  | <p>DV might not be able to ascertain the domain on which an ad was served and will report <i>N/A</i> in the following scenarios:</p> <ul style="list-style-type: none"> <li><b>Mobile Apps:</b> Because mobile apps do not have URLs, if an ad was served in a mobile app, <i>N/A</i> may appear in the <b>Delivery Site</b> column.</li> <li><b>Complex iFrame Layers:</b> Although DV technology is able to crawl through layers of iframes to identify an end site nearly 99% of the time, there are rare occasions, e.g., in very complex serving environments with many layers of iframes, where DV is unable to see past an ad server to the end domain.</li> </ul> |
| Inappropriate Content Site Categories Column | <p><i>N/A</i> may be displayed in the <b>Inappropriate Content Site Categories</b> column if the site is on the report for another reason, such as:</p> <ul style="list-style-type: none"> <li>Sitelist violations or blocks (<b>On Exclusion List</b> or <b>Off Inclusion List</b>)</li> <li>Page-level blocks due to page-level inappropriate content</li> <li>Keyword or custom category blocking</li> </ul>                                                                                                                                                                                                                                                           |
| Geographic Area Columns                      | <p><i>N/A</i> might appear in the <b>State/Region</b>, <b>DMA/MMA</b> or <b>Zip Code</b> column when an ad was served or requested in one of the following situations:</p> <ul style="list-style-type: none"> <li>If DV could not identify the location</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |

| Where N/A appears | Reason                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

For example, zip codes are reported for US locations only, and therefore the <a href="#">Zip Code</a> column would show <a href="#">N/A</a> if the ad originated outside of the United States.</li> </ul> <p>DV supports regional breakouts as follows:</p> <ul style="list-style-type: none"> <li>State/Region data in the following countries: <ul style="list-style-type: none"> <li>USA</li> <li>United Kingdom</li> <li>France</li> <li>Germany</li> <li>Canada</li> <li>Mexico</li> <li>Spain</li> <li>India</li> </ul> </li> <li>DMA/MMA in the following countries: <ul style="list-style-type: none"> <li>USA</li> <li>United Kingdom</li> <li>France</li> <li>Germany</li> </ul> </li> <li>Zip code in the USA</li> </ul> |

## Why is falsified-website.com in my site-level report?

Fraud bot ads reported on [falsified-website.com](#) (in the [Delivery Site](#) column of [site-level reports](#)) are ads DV has identified as served by a bot that is falsifying domains — DV segregates these bot-served ads from the websites they are attempting to mimic to ensure that targeted premium publishers are not penalized, and do not have their website performance impacted.

Falsifying domains is a type of bot behavior that involves manipulating ads so that they appear to be served on premium websites, when in reality these bots are creating page views on their own servers. DV is able to distinguish between the real website and the falsified website, and then prevent ads from being served to these bots.

## Viewability

IQ Viewability Advanced is a core measurement that, when combined with Digital IQ, gives both media buyers and sellers unprecedented insights into campaign performance.

The DV viewability methodologies and technologies are accredited as part of DV's MRC accreditation for Impression Quality services. DV was accredited by the MRC for our Impression Quality suite in early 2013; MRAID –certified mobile viewability for in-app viewability was accredited in 2016.

This section contains the following topics:

- Viewability methodologies
- Display viewability
- Video viewability
- In-app viewability

### Viewability methodologies

IQ Viewability Advanced employs various measurement methodologies to gather data about campaign viewability and performance for display and video viewability across desktop, mobile web and mobile in-app environments.

#### Desktop and mobile web viewability for display and video

The DV MRC-accredited viewability measure uses geometric methodology as the primary technique for collecting the data necessary for desktop and mobile web viewability measurements. Geometric calculations are made by comparing the viewable browser space to the position and size of the ad, taking into consideration whether the browser tab is active, and then calculating the percentage of the ad that is in view and for how long.

In certain browser and iFrame scenarios, where additional security limitations may prevent the use of geometric methodology, viewability may be ascertained using IAB-standard APIs to measure continuous signals from the browser to determine the percentage of the creative in view. In a small percentage of video and mobile web delivery scenarios, a resource-based methodology may be used.

## Mobile in-app viewability for display and video

DV measures display and video viewability in mobile in-app environments by leveraging the DV OM SDK data necessary to measure an ad, using the same geometric methodology used for desktop and mobile web delivery.

When the DV OM SDK is not available, DV uses MRAID signals that indicate whether an ad is “in view” or “not in view.” When an ad is “in view,” an additional signal is captured to measure the amount of time the ad is in view.

## Display viewability

The metrics reported for display viewability are defined in the following table.

**Note: All viewability collection is done using consecutive time.**

| Measure                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Display Viewable Impressions | <p>Impressions across desktop, mobile web and mobile in-app delivery that were measured as viewable according to the IAB viewability guideline:</p> <p>At least 50% of the creative, or 30% of the creative if considered to be a desktop "large ad", was in the viewable portion of a user's device for at least one continuous second.</p> <p>The <b>Display Viewable Rate</b> is calculated with the following formula: <b>Viewable Impressions/Measured Impressions</b>.<sup>2</sup></p>                                                                                                                                                                                                      |
| Custom Viewable Impressions  | <p>Impressions (desktop delivery only) that were in view as determined using the <b>Custom Viewability Measurement</b> definition for the profile. A Custom Viewability setting allows advertisers and agencies to define their own viewability standard - you can choose the percentage of the creative that must be in the viewable space and the length of time it must be in view.</p> <p>For example, a Custom Viewable Rate may define a <b>Viewable Impression</b> as one for which 70% of the creative was viewable for three seconds.</p> <p>The <b>Custom Viewable Rate</b> is calculated with the following formula: <b>Viewable Impressions/Measured Impressions</b>.<sup>2</sup></p> |

| Measure                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                          | <p>Note: The definition for Custom Viewability for each campaign is available on the Display Viewability profile, found in the Profiles section of IQ Blueprint (for partners, in the Monitoring Notification report).</p>                                                                                                                                                                                                                                                                                           |
| Viewability by Device Delivery Type      | <p>The <b>Viewability by Device Delivery Type</b> section on the <b>Insights</b> view shows the distribution of viewability and impressions across delivery types broken down by the device they were delivered by, if applicable:</p> <ul style="list-style-type: none"> <li>• In-App: Smartphone or Tablet</li> <li>• Mobile Web: Smartphone or Tablet</li> <li>• Desktop</li> <li>• Unknown/Other</li> </ul>                                                                                                      |
| Viewable Time Based Metrics              | <p>The count of impressions that were 50% in view for the following time intervals:</p> <ul style="list-style-type: none"> <li>• 50% Viewable 1-5 Secs Impressions</li> <li>• 50% Viewable 5-15 Secs Impressions</li> <li>• 50% Viewable ≥ 15 Secs Impressions</li> </ul>                                                                                                                                                                                                                                            |
| Display Measured Impressions             | <p>Impressions for which DV was able to obtain the information needed to make decisions about viewability. The <b>Measurement Rate</b>, which is calculated by dividing <b>Measured Impressions</b> by <b>Eligible Impressions</b>, provides a confidence level for each of the viewability dimensions so you can assess the broadness of the data used to determine a dimension.</p> <p>The <b>Measurement Rate</b> is calculated with the following formula: <b>Measured Impressions/Eligible Impressions</b>.</p> |
| Display Eligible Impressions             | Impressions that had the potential to be measured for viewability, which is the count of all impressions that include DV viewability measurement technology.                                                                                                                                                                                                                                                                                                                                                         |
| 100% Measurable Impressions <sup>3</sup> | The number of impressions where it is possible to determine whether 100% of the ad creative was in the viewable portion of the browser.                                                                                                                                                                                                                                                                                                                                                                              |
| 100% Viewable Impressions                | The number of impressions where 100% of the creative was in the viewable portion of the browser for at least one second.                                                                                                                                                                                                                                                                                                                                                                                             |
| 100% Viewable Rate                       | The percentage of impressions where 100% of the creative was in the viewable portion of the browser for at least one second.                                                                                                                                                                                                                                                                                                                                                                                         |

| Measure                                        | Description                                                                                                                                                                                                                                                                  |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Average Time – Display Viewable Impressions    | The average time, in seconds, of viewable impressions.<br>The <a href="#">Average Time – Display Viewable Rate</a> is calculated with the following formula: $(\text{Total Time (hr)} - \text{Display Viewable Impressions} / 3600) / \text{Display Viewable Impressions}$ . |
| Total Time (hr) – Display Viewable Impressions | The total time of viewable impressions in hours.                                                                                                                                                                                                                             |
| Total Time - Display Creative on Page          | The total time the page was open with the ad displayed.                                                                                                                                                                                                                      |
| Average Time – Display Creative on Page        | The average time the page was open with the ad displayed.                                                                                                                                                                                                                    |
| Total Time – Display Authentic Viewable        | The total brand exposure duration for all viewable impressions that were brand safe, fraud/SIVT free, and in the targeted geographic region (capped at 60 seconds per impression).                                                                                           |

### Facebook display viewability

DV IQ Performance delivers Facebook and Instagram display viewability data. The DV-Facebook measurement features an integration with signal-based measurement, which can be set up across your Facebook ad account.

Facebook display viewability data is available in the following Pinnacle views:

- Performance View > Summary > Facebook tab (provides a high-level summary of Facebook Display Viewability, Video Viewability and Fraud/SIVT)
- Performance View > Facebook > Tabs: Summary, Display, Video and Data (provides detailed insights on DV's Facebook integration).

Facebook viewability measurement is supported for the following ad formats:

- Link Post
- Page Like
- Photo
- Carousel
- App install
- Canvas\*
- Collection\*
- Lead Generation\*

Facebook-specific metrics also include, and are displayed with, the standard set of DV display viewability metrics (with the exception of custom viewability measurement and key message exposure), as defined in the [previous table](#).

The metrics reported for Facebook display viewability are defined in the following table.

**Note: All viewability collection is done using consecutive time.**

| Measure                                        | Description                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FB Display Standard Ads - Net <sup>3</sup>     | Facebook served and billable impressions; this includes deterministic impressions that have reached the [0,0] threshold, which means that more than 0% of the pixels passed through the viewport for more than zero seconds.                                                                                                                |
| 100% Display Viewable Impressions <sup>3</sup> | <p>The number of impressions where 100% of the creative was in the viewport for at least one second or the creative took up 100% of the viewport for at least one second.</p> <p>The <b>100% Display Viewable Rate</b> is calculated with the following formula: <b>100% Display Viewable Impressions/Display Measured Impressions</b>.</p> |
| Passthrough Impressions <sup>3</sup>           | The number of impressions where the top and bottom of the ad appeared on screen at least once while the user scrolled through the feed regardless of viewability.                                                                                                                                                                           |

\* Monitored Impressions and Passthrough Impressions only.

| Measure                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                 | The <b>Passthrough Rate<sup>3</sup></b> is calculated with the following formula: <b>Passthrough Impressions/Passthrough Measured Impressions</b> .                                                                                                                                                                                                                                                                                        |
| <b>One Second On-screen Passthrough Impressions<sup>3</sup></b> | <p>The number of <b>Display Measured Impressions</b> where at least one pixel was on screen for at least one continuous second, capped at 15 seconds, and the ad was a <b>Display Passthrough Impression</b>.</p> <p>The <b>One Second On-screen Passthrough Rate<sup>3</sup></b> is calculated with the following formula: <b>One Second On-screen Passthrough Impressions/One Second On-screen Passthrough Measured Impressions</b>.</p> |
| <b>Display 2-second Viewable Impressions</b>                    | <p>Impressions for which 50% or more of the ad creative was in view for two continuous seconds.</p> <p>The <b>Display 2-second Viewable Rate</b> is calculated with the following formula: <b>Display 2-second Viewable impressions/Display Measured Impressions</b>.</p>                                                                                                                                                                  |
| <b>Display 3-second Viewable Impressions</b>                    | <p>Impressions for which 50% or more of the ad creative was in view for three continuous seconds.</p> <p>The <b>Display 3-second Viewable Rate</b> is calculated with the following formula: <b>Display 3-second Viewable impressions/Display Measured Impressions</b>.</p>                                                                                                                                                                |

## Pinterest display viewability

DV IQ Performance delivers Pinterest display viewability data. Pinterest display viewability data is available in the following Pinnacle view:

- Performance View > Summary > Pinterest tab

The metrics reported for Pinterest Display Viewability are defined in the following table.

| Measure                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pinterest Standard Display Impressions <sup>3</sup>                    | The count of <a href="#">Display Measured Impressions</a> where at least one pixel was in view for one continuous second.                                                                                                                                                                                                                                                                                                                                                                                                |
| Pinterest Standard Display Viewable Impressions <sup>3</sup>           | <p>The count of <a href="#">Pinterest Standard Display Impressions</a> that were measured as viewable according to the IAB viewability guidelines:</p> <p>At least 50% of the creative was in the viewable portion of a user's device for one consecutive second or more.</p> <p>The <a href="#">Pinterest Standard Display Viewable Rate</a> is calculated with the following formula:<br/> <a href="#">Pinterest Standard Display Viewable Impressions</a>/<a href="#">Pinterest Standard Display Impressions</a>.</p> |
| Pinterest Standard Authentic Display Viewable Impressions <sup>3</sup> | <p>The count of <a href="#">Pinterest Standard Impressions</a> that were identified as <a href="#">Authentic</a> and also met the IAB standard for display viewability.</p> <p>The <a href="#">Pinterest Authentic Display Viewable Rate</a> is calculated with the following formula:<br/> <a href="#">Pinterest Standard Authentic Display Viewable Impressions</a>/<a href="#">Pinterest Standard Display Impressions</a>.</p>                                                                                        |
| Pinterest Standard Authentic Display Impressions <sup>3</sup>          | <p>The deduplicated count of impressions that were free from fraud/SIVT. The standard DV definition of <a href="#">Authentic</a> is:</p> <p>A deduplicated count of impressions that were brand safe, free from fraud/SIVT, and in the targeted geographic region.</p> <p>The <a href="#">Pinterest Standard Authentic Display Rate</a> is calculated with the following formula:<br/> <a href="#">Pinterest Standard Authentic Display Impressions</a>/<a href="#">Pinterest Standard Display Impressions</a>.</p>      |

| Measure                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100% Pinterest Standard Display Viewable Impressions <sup>3</sup>        | <p>The count of <a href="#">Pinterest Standard Display Impressions</a> where 100% of the creative was in the viewable portion of the browser for at least one second.</p> <p>The <a href="#">100% Pinterest Standard Display Viewable Rate</a> is calculated with the following formula: <math>\frac{100\% \text{ Pinterest Standard Display Viewable Impressions}}{\text{Pinterest Standard Display Impressions}}</math>.</p>                                          |
| Pinterest Standard Display Passthrough Measured Impressions <sup>3</sup> | The count of <a href="#">Pinterest Standard Display Impressions</a> for which DV was able to obtain the information needed to make decisions about passthrough.                                                                                                                                                                                                                                                                                                         |
| Pinterest Standard Display Passthrough Impressions <sup>3</sup>          | <p>The count of <a href="#">Pinterest Standard Display Passthrough Measured Impressions</a> where the top and bottom of the ad appeared on screen at least once while the user was scrolling on a page.</p> <p>The <a href="#">Pinterest Standard Display Passthrough Rate</a> is calculated with the following formula: <math>\frac{\text{Pinterest Standard Passthrough Impressions}}{\text{Pinterest Standard Display Passthrough Measured Impressions}}</math>.</p> |
| 50% Pinterest Standard Viewable 1-5 Secs Impressions <sup>3</sup>        | <p>The count of <a href="#">Pinterest Standard Impressions</a> for which 50% or more of the ad creative was in view for 1-4.9 seconds.</p> <p>The <a href="#">50% Pinterest Standard Viewable 1-5 Secs Rate</a> is calculated with the following formula: <math>\frac{50\% \text{ Pinterest Standard Viewable } &gt; 1-5 \text{ Secs Impressions}}{\text{Pinterest Standard Display Impressions}}</math>.</p>                                                           |
| 50% Pinterest Standard Viewable 5-15 Secs Impressions <sup>3</sup>       | <p>The count of <a href="#">Pinterest Standard Impressions</a> for which 50% or more of the ad creative was in view for 5-14.9 seconds.</p> <p>The <a href="#">50% Pinterest Standard Viewable 5-15 Secs Rate</a> is calculated with the following formula: <math>\frac{50\% \text{ Pinterest Standard Viewable } &gt; 5-15 \text{ Secs Impressions}}{\text{Pinterest Standard Display Impressions}}</math>.</p>                                                        |

| Measure                                                                         | Description                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 50% Pinterest Standard Viewable > 15 Secs Impressions <sup>3</sup>              | The count of <a href="#">Pinterest Standard Impressions</a> for which 50% or more of the ad creative was in view for 15 seconds.<br><br>The <a href="#">50% Pinterest Standard Viewable &gt;15 Secs Rate</a> is calculated with the following formula: <a href="#">50% Pinterest Standard Viewable &gt; 15 Secs Impressions/Pinterest Standard Display Impressions</a> . |
| Average Time (s) - Pinterest Standard Display Viewable Impressions <sup>3</sup> | The average time, in seconds, of <a href="#">Pinterest Standard Display Viewable Impressions</a> .                                                                                                                                                                                                                                                                       |
| Total Time (hr) - Pinterest Standard Display Viewable Impressions <sup>3</sup>  | The total time of <a href="#">Pinterest Standard Viewable Impressions</a> in hours.                                                                                                                                                                                                                                                                                      |

### Snapchat display viewability

DV IQ Performance delivers Snapchat display viewability data. Snapchat display viewability data is available in the following Pinnacle views:

- Performance View > Summary > Snapchat tab

Snapchat viewability measurement is supported for the following ad formats:

- Snap Ad Display
- Lens
- Filter
- Story Ad

Snapchat-specific metrics also include, and are displayed with, the standard set of DV display viewability metrics (with the exception of custom viewability measurement and key message exposure), as defined in the [previous table](#).

The metrics reported for Snapchat display viewability are defined in the following table.

| Measure                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Display Monitored Impressions <sup>3</sup>          | The total count of impressions served where DV monitoring services were applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Display Viewable/Engaged Impressions <sup>3</sup>   | <p>Impressions across mobile in-app and tablet in-app delivery that were measured as viewable according to the IAB viewability guidelines or had strong user interactions that indicated user engagement with the ad.</p> <p>The <b>Display Viewable/Engaged Rate</b> is calculated with the following formula: <math>(\text{Display Viewable/Engaged Impressions}) / \text{Display Measured Impressions}</math>.</p>                                                                                                                                                                                                                            |
| Display Authentic Impressions <sup>3</sup>          | <p>Impressions served in a brand-safe environment, free from fraud and other forms of SIVT, and in the targeted geographic region -- each DV <b>Authentic Impression®</b> is a distinct impression served in a high-quality environment that matches your brand-specific DV <b>Digital IQ</b> profile.</p> <p>Note: For Snapchat, this metric does not include geographic targeting and does not rely on DV Digital IQ profile settings.</p> <p>The <b>Display Authentic Impression Rate</b> is calculated with the following formula: <math>\text{Display Authentic Impressions} / \text{Display Monitored Impressions}</math>.<sup>1</sup></p> |
| Display Authentic Viewable Impressions <sup>3</sup> | <p>A <b>Display Authentic Viewable Impression</b> includes an additional layer of analysis that shows when an <b>Authentic Impression®</b> also met the IAB viewability guideline.</p> <p>The <b>Display Authentic Viewable Rate</b> is calculated with the following formula: <math>\text{Display Authentic Viewable Impressions} / \text{Display Measured Impressions}</math>.<sup>2</sup></p>                                                                                                                                                                                                                                                 |

## Video viewability

The metrics reported for video viewability are defined in the following table.

| Measure                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Video Viewable Impressions <sup>3</sup>        | <p>Impressions across desktop, mobile web and mobile in-app delivery that were measured as viewable according to the IAB viewability guideline:</p> <p>At least 50% of the creative was in the viewable portion of a user's device for two consecutive seconds or more.</p> <p>The <b>Video Viewable Rate</b> is calculated with the following formula: <b>Video Viewable Impressions/Measured Impressions</b>.<sup>2</sup></p>                                                                                                                                                                                                                                                                                                                                                   |
| Custom Video Viewable Impressions <sup>3</sup> | <p>Impressions across desktop, mobile web and mobile in-app delivery that were in view with audio turned on, on the player, as determined using the <b>Custom Viewability Measurement</b> definition for the profile. A <b>Custom Viewability</b> setting allows advertisers and agencies to define their own viewability standard - you can choose the percentage of the creative that must be in the viewable space and the length of time it must be in view.</p> <p>For example, a <b>Custom Viewable Rate</b> may define a Custom Viewable Impression as one for which 70% of the creative was viewable for three seconds.</p> <p>The <b>Video Viewable Rate</b> is calculated with the following formula: <b>Viewable Impressions/Measured Impressions</b>.<sup>2</sup></p> |
| Video Measured Impressions <sup>3</sup>        | <p>Impressions for which DV was able to obtain the information needed to make decisions about viewability. Knowing the <b>Video Measurement Rate</b> provides a confidence level for viewable impressions so you can assess the broadness of the data used to determine video viewable impressions.</p> <p>The <b>Measurement Rate</b> is calculated with the following formula: <b>Measured Impressions/Eligible Impressions</b>.</p>                                                                                                                                                                                                                                                                                                                                            |
| Video Eligible Impressions <sup>3</sup>        | <p>Impressions that had the potential to be measured for video viewability, which is the count of all impressions that include DV viewability measurement technology.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Measure                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Viewability by Device Delivery Type<sup>3</sup></b> | <p>The <b>Viewability by Device Delivery Type</b> section on the <b>Insights</b> view shows the distribution of viewability and impressions across delivery types broken down by the device they were delivered by, if applicable:</p> <ul style="list-style-type: none"> <li>• In-App: Smartphone or Tablet</li> <li>• Mobile Web: Smartphone or Tablet</li> <li>• Desktop</li> <li>• Unknown/Other</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Viewability by Player Size<sup>3</sup></b>          | <p>The <b>Viewability Player Size</b> section on the <b>Insights</b> view shows how video ads were distributed across different-sized players. Player size helps you see the quality of the environment in which your ad was served, as small players may be a less than optimal viewing environment. DV provides both the amount of impressions served into each player and the viewable rates within each player size.</p> <ul style="list-style-type: none"> <li>• <b>≤300x250</b>: The player size is less than or equal to 300 by 250 pixels where the shorter side is less than 250 pixels.</li> <li>• <b>301x251 - 399x299</b>: The player size is between 301 by 251 pixels and 399 by 299 pixels where the shorter side is between 251 and 299 pixels.</li> <li>• <b>400x300 - 639x479</b>: The player size is between 400 by 300 pixels and 639 by 479 pixels where the shorter side is between 300 and 479 pixels.</li> <li>• <b>≥640x480</b>: The player size is greater than or equal to 640 by 480 pixels where the shorter side is at least 480 pixels.</li> <li>• <b>Unknown</b>: Impressions where DV was not able to determine the player size. This also includes viewability-enabled impressions for which DV was not able to measure for video viewability.</li> </ul> <p><b>Note:</b> The IAB recommended size for in-stream video ads is 640x480 and the IAB minimum size for in-stream video ads is 400x300.</p> |
| <b>Audible Impressions<sup>3</sup></b>                 | <p>The number of impressions that had audio turned on, on the player, for any time duration.</p> <p>The <b>Audible Rate<sup>3</sup></b> is calculated with the following formula: <b>Audible Impressions/Audible Measured Impressions</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Measure                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Audible Measured Impressions <sup>3</sup>           | The count of video impressions for which DV was able to obtain the information needed to determine whether audio was on or not muted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Audible Rate per Quartile <sup>3</sup>              | <p>The percentage of impressions measured to be audible during each quartile of the video.</p> <p>The <b>Audible Rate per Quartile</b> is calculated with the following formulas:</p> <ul style="list-style-type: none"> <li>• <math>\text{Q1 Audible Impressions} / \text{Audible Measured Impressions}</math></li> <li>• <math>\text{Q2 Audible Impressions} / \text{Audible Measured Impressions}</math></li> <li>• <math>\text{Q3 Audible Impressions} / \text{Audible Measured Impressions}</math></li> <li>• <math>\text{Q4 Audible Impressions} / \text{Audible Measured Impressions}</math></li> </ul>                                                                                                                      |
| Audible Viewable Impressions <sup>3</sup>           | <p>The number of impressions that were viewable and had audio turned on, on the player, for any time duration.</p> <p>The <b>Audible Viewable Rate<sup>3</sup></b> is calculated with the following formula: <math>\text{Audible Viewable Impressions} / \text{Audible Measured Impressions}</math>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Audible Viewable Measured Impressions <sup>3</sup>  | The count of <b>Video Impressions</b> for which DV was able to obtain the information needed to determine viewability as well as whether audio was on or not muted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Audible and Viewable Rate per Quartile <sup>3</sup> | <p>The percentage of impressions that were viewable and had audio turned on, on the player, in each quartile of the video.</p> <p>The <b>Audible and Viewable Rate per Quartile</b> is calculated with the following formulas:</p> <ul style="list-style-type: none"> <li>• <math>\text{Q1 Audible Viewable Impressions} / \text{Audible Viewable Measured Impressions}</math></li> <li>• <math>\text{Q2 Audible Viewable Impressions} / \text{Audible Viewable Measured Impressions}</math></li> <li>• <math>\text{Q3 Audible Viewable Impressions} / \text{Audible Viewable Measured Impressions}</math></li> <li>• <math>\text{Q4 Audible Viewable Impressions} / \text{Audible Viewable Measured Impressions}</math></li> </ul> |
| Viewable Rate per Quartile <sup>3</sup>             | <p>The percentage of viewable impressions in each quartile of the video.</p> <p>The <b>Viewable Rate per Quartile</b> is calculated with the following formulas:</p> <ul style="list-style-type: none"> <li>• <math>\text{Q1 Viewable Impressions} / \text{Video Viewable Measured Impressions}</math></li> <li>• <math>\text{Q2 Viewable Impressions} / \text{Video Viewable Measured Impressions}</math></li> <li>• <math>\text{Q3 Viewable Impressions} / \text{Video Viewable Measured Impressions}</math></li> <li>• <math>\text{Q4 Viewable Impressions} / \text{Video Viewable Measured Impressions}</math></li> </ul>                                                                                                       |

| Measure                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Player Size per Quartile <sup>3</sup>                   | The width and height of the player at the end of each quartile of the video, aggregated into one of four player size groupings. (See <a href="#">Viewability by Player Size</a> above for player size groups.)                                                                                                                                                                                                                                                                                                                                                  |
| 100% Viewable Through Quartile Impressions <sup>3</sup> | <p>The count of impressions where the creative was 100% in view from the video's start to the end of each respective quartile:</p> <ul style="list-style-type: none"> <li>• 100% Viewable through Q1 Impressions</li> <li>• 100% Viewable through Q2 Impressions</li> <li>• 100% Viewable through Q3 Impressions</li> <li>• 100% Viewable through Q4 Impressions</li> </ul>                                                                                                                                                                                     |
| 100% Viewable Through Qx Rate <sup>3</sup>              | <p>The percentage of viewable measured impressions where 100% of the creative was in view through each quartile.</p> <p>The 100% Viewable through Qx Rates are calculated with the following formulas:</p> <ul style="list-style-type: none"> <li>• 100% Viewable through Q1 Impressions/Video Measured Impressions</li> <li>• 100% Viewable through Q2 Impressions/Video Measured Impressions</li> <li>• 100% Viewable through Q3 Impressions/Video Measured Impressions</li> <li>• 100% Viewable through Q4 Impressions/Video Measured Impressions</li> </ul> |
| Quartile Completion Measured Impressions <sup>3</sup>   | The count of video impressions for which DV was able to obtain the information needed to determine quartile completions.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Audible and In-View on Completion (AVOC) <sup>3</sup>   | <p>The percentage of impressions where 50% or more of the creative was in view and had audio turned on, on the player, at the completion of the video.</p> <p>The Audible and In-View on Completion (AVOC) Rate is calculated with the following formula: Audible and In-View on Completion Impressions/Audible Viewable Measured Impressions.</p>                                                                                                                                                                                                              |

| Measure                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key Message Exposure Impressions <sup>3</sup> | <p>The amount of impressions that met the key message exposure requirements.</p> <p>Key message exposure lets you customize the percentage of an ad required to be the viewable portion of the browser, the duration at which the ad is in view, and whether the audio on the player is turned on.</p> <p>For example, an ad may display the logo and call to action at the end of the video. In this case, you can set key message exposure to the last two seconds of the video, with audio turned on and 100% of the creative in the viewable space.</p> <p>The <b>Key Message Exposure Rate</b> is calculated with the following formula: <b>Key Message Exposure Impressions/Measured Impressions</b>.</p>                                                  |
| Video Completion Metrics <sup>3</sup>         | <p>The length of time, in quartiles, that a video creative played continuously at normal speed. This metric does not account for whether the video was viewable and/or audible.</p> <p>The <b>Video Completed Rate per Quartile</b> is calculated with the following formulas:</p> <ul style="list-style-type: none"> <li>• <math>\text{Q1 Completed Impressions} / \text{Quartile Completion Measured Impressions}</math></li> <li>• <math>\text{Q2 Completed Impressions} / \text{Quartile Completion Measured Impressions}</math></li> <li>• <math>\text{Q3 Completed Impressions} / \text{Quartile Completion Measured Impressions}</math></li> <li>• <math>\text{Completed Impressions} / \text{Quartile Completion Measured Impressions}</math></li> </ul> |

## Facebook video viewability

DV IQ Performance delivers Facebook, Instagram and Audience Network video viewability data. The DV-Facebook measurement features an integration with signal-based measurement, which can be set up across your Facebook ad account.

Facebook and Instagram video viewability data is located in these views:

- Performance View > Summary > Facebook tab
- Performance View > Data > Video tab

Facebook and Instagram video viewability measurement is supported for the following ad formats:

- Video
- Video Link
- 360° video
- Carousel
- App install
- Slideshow
- Canvas
- Collection
- Lead Generation

Audience Network video viewability measurement is supported for the following ad formats:

- Interstitial
- Banner
- Native
- In-stream video
- Full-width
- Native Banner
- Native Desktop
- Medium Rectangle Desktop

Facebook-specific metrics also include, and are displayed with, the standard set of DV video viewability metrics (with the exception of custom viewability measurement and key message exposure), as defined in the [previous table](#).

The metrics reported for Facebook video viewability are defined in the following table.

**Note: All viewability collection is done using consecutive time.**

| Measure                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FB Video Standard Ads - Net <sup>3</sup>                             | <p>Facebook served and billable impressions; this includes deterministic impressions that have reached the [0,0] threshold, which means that more than 0% of the pixels passed through the viewport for more than zero seconds.</p> <p>This metric does not check, or take into account, whether the ad started to play or not.</p>                                                                                                                                                                                       |
| Video 3-second Viewable Impression <sup>3</sup>                      | <p>Impressions for which 50% or more of the ad creative was in view for three continuous seconds. If the total ad duration is less than three seconds, then 50% or more of the ad creative was in view for the entire duration of the ad.</p> <p>The <b>Video 3-second Viewable Rate</b> is calculated with the following formula: <b>Video 3-second Viewable Impressions/Video Measured Impressions</b>.</p>                                                                                                             |
| Midpoint 50% On-screen Passthrough Impressions <sup>3</sup>          | <p>The number of <b>Video Measured Impressions</b> where 50% or more of the ad was on screen for half the video duration, capped at 15 seconds, and the ad was a <b>Video Passthrough Impression</b>.</p> <p>The <b>Midpoint 50% On-screen Passthrough Rate<sup>3</sup></b> is calculated with the following formula: <b>Midpoint 50% On-screen Passthrough Impressions/ Midpoint 50% On-screen Passthrough Measured Impressions</b>.</p> <p>This metric is not supported in Audience Network and Facebook In-Stream.</p> |
| Midpoint 50% On-screen Passthrough Measured Impressions <sup>3</sup> | <p>Impressions for which DV was able to obtain the information needed to make decisions about half duration 50% on-screen passthrough.</p> <p>This metric is not supported in Audience Network and Facebook In-Stream.</p>                                                                                                                                                                                                                                                                                                |
| Midpoint 50% On-screen Passthrough Impressions, Fraud/SIVT-          | <p>The number of <b>Video Measured Impressions</b> where 50% or more of the ad was on screen for half the video duration, capped at 15 seconds, and the ad was a <b>Video Passthrough Impression</b>. Additionally, there were no incidents of <b>Fraud/SIVT</b> identified.</p>                                                                                                                                                                                                                                          |

| Measure                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| free <sup>3</sup>                                                                          | <p>The <b>Midpoint 50% On-screen Passthrough Rate, Fraud/SIVT-Free<sup>3</sup></b> is calculated with the following formula: <b>Midpoint 50% On-screen Passthrough Impressions, Fraud/SIVT-Free/ Midpoint 50% On Screen Passthrough Measured Impressions</b>.</p> <p>This metric is not supported in Audience Network and Facebook In-Stream.</p>                                                                                                                                                                                                                                                                                                                                                                |
| <b>Midpoint 50% On-screen Passthrough Audible Impressions<sup>3</sup></b>                  | <p>The number of <b>Video Measured Impressions</b> where 50% or more of the ad was on-screen for half the video duration, capped at 15 seconds, and the ad was a <b>Video Passthrough Impression</b> and had audio turned on, on the player, for any time duration.</p> <p>The <b>Midpoint 50% On-screen Passthrough Audible Rate<sup>3</sup></b> is calculated with the following formula: <b>Midpoint 50% On-screen Passthrough Audible Impressions/ Midpoint 50% On Screen Passthrough Measured Impressions</b>.</p> <p>This metric is not supported in Audience Network and Facebook In-Stream.</p>                                                                                                          |
| <b>Midpoint 50% On-screen Passthrough Audible Impressions, Fraud/SIVT-free<sup>3</sup></b> | <p>The number of <b>Video Measured Impressions</b> where 50% or more of the ad was on screen for half the video duration, capped at 15 seconds, and the ad was a <b>Video Passthrough Impression</b> and had audio turned on, on the player, for any time duration. Additionally, there were no incidents of <b>Fraud/SIVT</b> identified.</p> <p>The <b>Midpoint 50% On-screen Passthrough Audible Rate, Fraud/SIVT-free<sup>3</sup></b> is calculated with the following formula: <b>Midpoint 50% On-screen Passthrough Audible Impressions, Fraud/SIVT-Free/ Midpoint 50% On Screen Passthrough Measured Impressions</b>.</p> <p>This metric is not supported in Audience Network and Facebook In-Stream.</p> |
| <b>Auto-Play Video Impressions<sup>3</sup></b>                                             | A video impression, or a video impression linked with video content, that initiates play without user interaction or a user actively starting the video.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Click-to-Play Video Impressions<sup>3</sup></b>                                         | A video impression, or a video impression linked with video content, that initiates only when a user interacts with and actively starts playing the video.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Unknown Play Impressions<sup>3</sup></b>                                                | A video impression, or a video impression linked with video content, for which the auto-play or click-to-play status of could not be determined when the video ad began to play.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Pinterest video viewability

DV IQ Performance delivers Pinterest video viewability data. Pinterest video viewability data is available in the following Pinnacle view:

- Performance View > Summary > Pinterest tab

The metrics reported for Pinterest Video Viewability are defined in the following table.

| Measure                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Snapchat video viewability

DV IQ Performance delivers Snapchat video viewability data. Snapchat video viewability data is located in these views:

- Performance View > Summary > Snapchat tab

Snapchat video viewability measurement is supported for the following ad format:

- Snap Ad Video

Snapchat-specific metrics also include, and are displayed with, the standard set of DV video viewability metrics (with the exception of custom viewability measurement and key message exposure), as defined in the [previous table](#).

The metrics reported for Snapchat video viewability are defined in the following table.

| Measure                                         | Description                                                                                                                                                                                                       |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Video Monitored Impressions <sup>3</sup>        | The total count of impressions served where DV <a href="#">Monitoring</a> services were applied.                                                                                                                  |
| Video Viewable/Engaged Impressions <sup>3</sup> | Impressions across mobile in-app and tablet in-app delivery that were measured as viewable according to the IAB viewability guidelines or had strong user interactions that indicate user engagement with the ad. |

| Measure                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                         | The <b>Video Viewable/Engaged Rate</b> is calculated with the following formula: $(\text{Video Viewable/Engaged Impressions}) / \text{Video Measured Impressions}$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Video Full Screen Impressions<sup>3</sup></b>        | <p>The count of impressions where the ad was expanded to full screen.</p> <p>The <b>Video Full Screen Rate</b> is calculated with the following formula: <math>\text{Video Full Screen Impressions} / \text{Video Measured Impressions}</math>.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>100% Video Viewable Impressions<sup>3</sup></b>      | <p>The count of video impressions where 100% of the creative was in the viewport for at least two continuous seconds.</p> <p>The <b>100% Video Viewable Rate<sup>3</sup></b> is calculated with the following formula: <math>100\% \text{ Video Viewable Impressions} / \text{Measured Impressions}</math>.</p>                                                                                                                                                                                                                                                                                                                     |
| <b>Video Authentic Impressions<sup>3</sup></b>          | <p>Impressions served in a brand-safe environment, free from fraud and other forms of SIVT, and in the targeted geographic region -- each DV <b>Authentic Impression®</b> is a distinct impression served in a high-quality environment that matches your brand-specific DV Digital IQ profile.</p> <p>Note: For Snapchat, this metric does not include geographic targeting and does not rely on DV Digital IQ profile settings.</p> <p>The <b>Video Authentic Impression Rate</b> is calculated with the following formula: <math>\text{Video Authentic Impressions} / \text{Video Monitored Impressions}</math>.<sup>1</sup></p> |
| <b>Video Authentic Viewable Impressions<sup>3</sup></b> | <p>A <b>Video Authentic Viewable Impression</b> includes an additional layer of analysis that shows when an <b>Authentic Impression®</b> also met the IAB viewability guideline.</p> <p>The <b>Video Authentic Viewable Rate</b> is calculated with the following formula: <math>\text{Video Authentic Viewable Impressions} / \text{Video Measured Impressions}</math>.<sup>2</sup></p>                                                                                                                                                                                                                                            |
| <b>Q1 Completed Impressions<sup>3</sup></b>             | The count of impressions that completed the first quartile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Q2 Completed Impressions<sup>3</sup></b>             | The count of impressions that completed the second quartile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Q3 Completed Impressions<sup>3</sup></b>             | The count of impressions that completed the third quartile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Completed Impressions<sup>3</sup></b>                | The count of impressions that completed all quartiles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Twitter video viewability

DV IQ Performance delivers Twitter video viewability data. The DV-Twitter measurement features an integration with signal-based measurement, which can be set up across your Twitter ad account.

Twitter video viewability data is located in the following views:

- Performance View > Twitter Video tab
- Performance View > Twitter > Tabs: Video and Data (provides detailed insights on DV's Twitter integration)

Twitter video viewability measurement is supported for the following ad formats:

- Promoted video
- In-stream video (pre-roll and sponsorships)
- GIFs
- Promoted trend

Twitter-specific metrics also include, and are displayed with, the standard set of DV display viewability metrics (with the exception of custom viewability measurement and key message exposure), as defined in the [previous table](#).

The metrics reported for Twitter video viewability are defined in the following table.

| Measure                                            | Description                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Twitter Video Full Screen Impressions <sup>3</sup> | <p>The number of impression where the ad was expanded to full screen in the Twitter app.</p> <p>The <b>Twitter Video Full Screen Rate<sup>3</sup></b> is calculated with the following formula: <b>Twitter Video Full Screen Impressions/Video Measured Impressions</b>.</p>                       |
| Twitter Video Viewable Impressions <sup>3</sup>    | <p>The number of impressions where 100% of the player was visible and focused for at least three cumulative seconds.</p> <p>The <b>Twitter Video Viewable Rate<sup>3</sup></b> is calculated with the following formula: <b>Twitter Video Viewable Impressions/Video Measured Impressions</b>.</p> |

## YouTube video viewability

DV IQ Performance delivers viewability insights across YouTube campaigns. DV viewability measures across multiple YouTube ad formats, including TrueView In-stream, Bumper Ads, Standard In-stream, In-stream Select and Google Preferred.

YouTube video viewability employs the standard set of DV video viewability metrics (with the exception of custom and key message exposure), as defined in the [previous table](#).

YouTube video viewability data is available in the following Pinnacle views:

- Performance View > Summary > YouTube tab
- Performance View > YouTube > Viewability tab
- Performance View > Summary > YouTube - Legacy tab
- Performance View > YouTube - Legacy > YT Viewability tab

## In-app viewability

The metrics reported for in-app display and video viewability are defined in the following table.

| Measure                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In-App Viewable Impressions (Display or Video)                   | <p>Impressions from in-app delivery that were measured as viewable according to the IAB viewability guidelines: at least 50% of the creative was in the viewable portion of a user's device for one consecutive second or more for display or for two consecutive seconds or more for video.</p> <p>The <b>Viewable Rate</b> is calculated with the following formula: <b>Viewable Impressions/Measured Impressions</b>.<sup>2</sup></p> |
| In-App Viewable Rate (Certified Imps)                            | The percentage of viewable impressions from in-app delivery that are from partners with a <b>Measurement Status</b> of <b>Certified</b> .                                                                                                                                                                                                                                                                                                |
| In-App Viewability by Mobile OS (Display and Video) <sup>3</sup> | <p>The <b>Viewability by Mobile OS</b> section on the <b>Insights</b> view shows the distribution of impressions and their viewability rates by operating system for both display and video:</p> <ul style="list-style-type: none"> <li>• iOS</li> <li>• Android</li> <li>• Other</li> </ul>                                                                                                                                             |

| Measure                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In-App Viewability by Device Delivery Type (Display or Video) <sup>3</sup> | <p>The <a href="#">Viewability by Device Delivery Type</a> sections on the <a href="#">Insights</a> view shows the distribution of impressions and their viewability across the different types of devices for Display or Video:</p> <ul style="list-style-type: none"> <li>• In-App: Smartphone or Tablet</li> <li>• Mobile Web: Smartphone or Tablet</li> <li>• Desktop</li> <li>• Unknown</li> </ul>                                                                                                                                                                                                     |
| In-App Measured Impressions (Display or Video)                             | <p>Impressions for which DV was able to obtain the information needed to make decisions about viewability. The <a href="#">In-App Measurement Rate</a>, which is calculated by dividing <a href="#">In-App Measured Impressions</a> by <a href="#">In-App Eligible Impressions</a>, provides a confidence level for each of the viewability dimensions so you can assess the broadness of the data used to determine a dimension.</p> <p>The <a href="#">In-App Measurement Rate</a> is calculated with the following formula: <a href="#">In-App Measured Impressions/In-App Eligible Impressions</a>.</p> |
| In-App Eligible Impressions (Display and Video)                            | Impressions that had the potential to be measured for viewability, which is the count of all impressions that include DV viewability measurement technology.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## DV in-app viewability measurement certification

The DV MRAID Measurement Certification program, a program that is unique to the industry, works with vendors to review and test the accuracy of their MRAID implementation so that DV can guarantee the quality of the MRAID viewability measurement.

DV reports measurement certified viewable impressions on your inventory whenever a certified supplier or demand platform is part of the ad-serving chain for that impression. DV viewability measurement certified impressions are impressions where DV guarantees that MRAID is implemented correctly, and that the measurement that is taking place is accurate and reliable.

### *DV measurement certification status filter*

The **Measurement Certification Status** filter is available in the Insights > Mobile In-App view.

- **Certified:** Impressions served by partners who have undergone the DV mobile measurement certification process and whose measurement signals are determined to be reliable and accurate. This also includes impressions from partners using the OM SDK.
- **Non-Certified:** Impressions served by partners who have not yet been certified under the DV mobile measurement certification process.

## Fraud/SIVT

The DV IQ Fraud Advanced solution is the most powerful and proven market solution for combating sophisticated digital fraud and invalid traffic schemes. Since its founding in 2008, DV has been at the forefront of uncovering, and protecting against, ad impression manipulation such as bot and site fraud. DV has broadened the scope of its IQ Fraud Advanced service to include the ability to uncover other forms of sophisticated invalid traffic, such as nonhuman data center traffic and injected ads.

Fraud/SIVT metrics provide counts of ads served to sites participating in fraudulent activity, bot fraud, nonhuman data center traffic and injected ads.

These values are available only for clients who have signed up for the premium IQ Fraud Advanced service. If they have not signed up for Fraud Advanced, N/A is displayed in these areas.

|                                               | & Blocking                             | <p>Bot fraud occurs when ads are served to a fraudulent nonhuman requestor. DV identifies fraudulent bots using patent-pending proprietary methodology developed by our fraud experts, who have decades of experience in the field of online advertising. DV evaluates all traffic seen by the DV OmniTag using multiple sophisticated methods to look for users exhibiting suspicious behaviors and patterns indicative of nonhuman and automated activity. The DV fraud bot identification methodology utilizes advanced behavioral modeling to analyze ad activity and positively identify nonhuman and automated browsers and apps using three key types of data: spoofed browser information, irregular machine characteristics and abnormal/unachievable browsing patterns.</p> | <p><b>Incident Rate</b><br/>           Bot Fraud Incidents<sup>3</sup>/Monitored Ads<sup>1</sup></p> <p><b>Block Rate</b><br/>           Bot Fraud Blocks<sup>3</sup>/Requests</p>                                                                                                                                                             |

<sup>†</sup> Classifying a site or app as Site & App Fraud/IVT is based entirely on the advertising ads served on or through the site/app and is not an assessment that the site/app was aware of or knowingly participated in the Ad Impression Fraud. Ad Impression Fraud refers to the manipulation of ad serving, ad display or traffic activity such that ad impression measurements are incremented inappropriately because the ads cannot be viewed by a user, are not served within operationally viewable parameters or were displayed as a result of machine-generated traffic. As used in this category definition, Ad Fraud is not intended to represent fraud as defined in various laws, statutes and ordinances or as conventionally used in courts or other legal proceedings, but rather a custom definition strictly for advertising measurement purposes.

## Brand Safety

The DV Brand Safety settings can record incidents of ads being served on sites, or next to content, that do not meet your brand positioning standards and insertion order guidelines. Blocking prevents ads from being served when they do not meet impression delivery standards.

**Note:** For campaigns that include web and app impressions, both the website and the app must meet the profile's brand safety settings to be considered brand safe.

IQ Performance reports metrics for the following brand safety violations:

- Brand safety filters, incidents and blocks
- Brand safety miscellaneous
- Brand safety and suitability

### Brand safety filters, incidents and blocks

| Measure             | Product                                | Description                                                                                                                                                                                                                                                                                                                                                                                                           | Rate Calculation                                                                                                                                                                                                                                                                                      |

## Brand safety miscellaneous

Brand safety miscellaneous are a deduplicated count of filters or blocks based on sites where DV did not evaluate the content.

| Measure                    | Product                    | Description                                                                                                                                                                                                                                                                                                                                                                                         | Rate Calculation                                                                                                                                                                                    |
|----------------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Brand Safety Miscellaneous | Video Filtering & Blocking | <p>The <b>Brand Safety Miscellaneous Filters</b><sup>3</sup> or <b>Blocks</b> number is an aggregated count of the following:</p> <ul style="list-style-type: none"> <li>Middleware Site</li> <li>New Site</li> <li>No Domain</li> </ul> <p><b>Brand Safety Miscellaneous Filters</b> or <b>Blocks</b> represent the count of filters or blocks on sites where DV did not evaluate the content.</p> | <p><b>Filter Rate</b><sup>3</sup><br/> <b>Miscellaneous Filters</b><sup>3</sup> / <b>Evaluations</b><sup>3</sup></p> <p><b>Block Rate</b><br/> <b>Miscellaneous Blocks/Requests</b><sup>1</sup></p> |
| Middleware Site            | Video Filtering & Blocking | The count of <b>Filters</b> or <b>Blocks</b> due to requests from a site identified as an ad server or middleware site. This may happen if DV is unable to "see through" to the final domain from which the ad was requested.                                                                                                                                                                       | <p><b>Filter Rate</b><sup>3</sup><br/> <b>Middleware Filters</b><sup>3</sup> / <b>Evaluations</b><sup>3</sup></p> <p><b>Block Rate</b><br/> <b>Middleware Blocks/Requests</b><sup>1</sup></p>       |
| New Site                   | Video Filtering & Blocking | The count of <b>Filters</b> or <b>Blocks</b> where the domain is a site that is not in the system because it has not requested an ad before.                                                                                                                                                                                                                                                        | <p><b>Filter Rate</b><sup>3</sup><br/> <b>New Site Filters</b><sup>3</sup> / <b>Evaluations</b><sup>3</sup></p>                                                                                     |

| Measure   | Product                    | Description                                                                                                                                                                                                                 | Rate Calculation                                                                                                                                  |
|-----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|           |                            | By default, all new sites are considered inappropriate content and blocked. However, all sites are classified within hours of being added to the system.                                                                    | <b>Block Rate</b><br>$\text{New Site Blocks/Requests}^1$                                                                                          |
| No Domain | Video Filtering & Blocking | The count of <b>Filters</b> or <b>Blocks</b> where the blocking tag was unable to identify the domain from the value retrieved from the site requesting an ad because the value received was a local path or an IP address. | <b>Filter Rate</b> <sup>3</sup><br>$\text{No Domain Filters}^3/\text{Evaluations}^3$<br><b>Block Rate</b><br>$\text{No Domain Blocks/Requests}^1$ |

## Category tiering

Inappropriate Content Categories provide a granular assessment of content on sites (at the domain and page levels) and mobile apps. DV offers a market-leading 75+ unique brand safety and suitability category settings — inclusive of 13 categories with three levels of risk, in addition to 50 categories without suitability tiers.

The metrics reported for analyzing traffic for these risk tiered categories.

| Measure                             | Description                                                                                                                                |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| "Share of" Metric <sup>3</sup>      | Indicates the share of the corresponding metric belonging to a specific category from the overall deduplicated count of the same value     |
| Share of Requests <sup>3</sup>      | Requests for a single category divided by the total number of requests across all categories                                               |
| Share of Monitored Ads <sup>3</sup> | Monitored Ads for a single category divided by the total number of Monitored Ads across all categories                                     |
| Share of Allowed Ads <sup>3</sup>   | Allowed Ads for a single category divided by total Allowed Ads across all categories.                                                      |
| Share of Authentic Ads <sup>3</sup> | Authentic Ads for a single category divided by the total number of Authentic Ads across all categories                                     |
| "Impact" Metric <sup>3</sup>        | Indicates the increase of <b>Block Rate</b> or decrease of <b>Authentic Rate</b> if a category was added to the Inappropriate Content list |

| Measure                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Impact to Block Rate if Added to IC <sup>3</sup>     | Allowed Ads for a single category divided by the total number of requests across all categories                                                                                                                                                                                                                                                                                                                                                                                                                |
| Impact to Authentic Rate if Added to IC <sup>3</sup> | Authentic Ads for a single category divided by the total number of Monitored Ads across all categories                                                                                                                                                                                                                                                                                                                                                                                                         |
| "Incremental" Metric <sup>3</sup>                    | <p>The number of violations that were triggered exclusively due to an Inappropriate Content Category setting. This number is a subset of Inappropriate Content Incidents or Blocks where:</p> <ul style="list-style-type: none"> <li>• There are no other violations outside of Inappropriate Content on the same impression (such as Fraud, other Brand Safety or Geo)</li> <li>• There are no other categories associated with the same impression that is also on the Inappropriate Content list</li> </ul> |
| IC Incremental Blocks <sup>3</sup>                   | The number of requests that were blocked but would be allowed if a category were removed from the Inappropriate Content list.                                                                                                                                                                                                                                                                                                                                                                                  |
| IC Incremental Incidents <sup>3</sup>                | The number of impressions that would become Authentic if a category were to be removed from the Inappropriate Content list.                                                                                                                                                                                                                                                                                                                                                                                    |

## Brand safety and suitability

DV has partnered with YouTube to create greater transparency by bringing Brand Safety and Suitability measurement to video advertisers. This solution provides an extra layer of insights into ads running against content that may be unsuitable for their brand.

DV IQ Performance delivers YouTube Brand Safety and Suitability data. YouTube Brand Safety and Suitability data is available in the following views:

- Performance View > Summary > YouTube tab
- Performance View > Summary > YouTube - Legacy tab
- Performance View > YouTube > YT Brand Safety/Suitability tab

The metrics reported for YouTube Brand Safety and Suitability are defined in the following table.

| Measure                                                         | Description                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| YT Safety/Suitability (S/S) Monitored Impressions <sup>3</sup>  | The number of impressions served where the <b>Brand Safety</b> and <b>Brand Suitability</b> services were activated by Google.                                                                                                                                                                                                  |
| YT Safety/Suitability (S/S) Measured Impressions <sup>3</sup>   | The number of impressions where a video classification existed at impression time.                                                                                                                                                                                                                                              |
| YT Safety/Suitability (S/S) Unmeasured Impressions <sup>3</sup> | The number of impressions for which a brand safety or suitability classification could not be determined at the time of delivery. Examples of <b>Unmeasured Impressions</b> are impressions run against videos that were removed from the YouTube platform or videos that feature languages that DV does not currently support. |
| YT Safety/Suitability (S/S) Measurement Rate <sup>3</sup>       | The rate of impressions on videos where brand safety and/or suitability was measured.                                                                                                                                                                                                                                           |
| YT Brand Safe Impressions <sup>3</sup>                          | The number of impressions where a video classification is not one of the categories selected in the YouTube profile.                                                                                                                                                                                                            |
| YT Brand Safety Incidents <sup>3</sup>                          | The number of impressions that triggered a <b>Brand Safety Incident</b> based on the categories selected in the YouTube profile.<br><br>The <b>YT Brand Safety Incident Rate</b> is calculated with the following formula: <b>YT Brand Safety Incidents/Measured Impressions</b> .                                              |

| Measure                              | Description                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| YT Brand Safe Rate <sup>3</sup>      | <p>The rate of impressions served on videos without any <b>Brand Safety</b> incidents.</p> <p>The <b>YT Brand Suitability Rate</b> is calculated with the following formula: <b>YT Brand Safe Impressions/Measured Impressions</b>.</p>                                                               |
| YT Suitable Impressions <sup>3</sup> | The number of impressions where a video classification does not match any of the suitability categories selected in the YouTube profile.                                                                                                                                                              |
| YT Suitable Rate <sup>3</sup>        | <p>The rate of impressions where a video classification does not match any of the suitability categories selected in the YouTube profile.</p> <p>The <b>YT Suitable Rate</b> is calculated with the following formula: <b>YT Suitable Impressions/Measured Impressions</b>.</p>                       |
| YT Unsuitable Incidents <sup>3</sup> | <p>The number of impressions where a video classification matches one of the suitability categories selected in the YouTube profile.</p> <p>The <b>YT Unsuitable Incident Rate</b> is calculated with the following formula: <b>YT Unsuitable Incidents /Measured Impressions</b>.</p>                |
| YT Unique Incidents <sup>3</sup>     | <p>The deduplicated count of all impressions that were fraudulent and flagged as Brand Safety incidents per the criteria outlined in the DV YouTube Profile.</p> <p>The <b>YT Unique Incident Rate</b> is calculated with the following formula: <b>Unique Incidents / Monitored Impressions</b>.</p> |

## Violations

Total Violations provide a baseline for assessing a site's performance. This single measure delivers a means of identifying problematic sites regardless of the type of service being leveraged.

| Measure                       | Description                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------|
| Total Violations <sup>3</sup> | A sum total of any <b>Brand Safety</b> and <b>Fraud</b> violations, whether it is blocking or incidents. |

## Geo

Geo represents the unique count of ads that were monitored or blocked for falling outside of your targeted country, designated market areas (or media market areas outside of the US), state/region or zip code, as defined in your Geo Targeting profile.

DV provides monitoring and blocking based on an ad's location, which is determined using the user's IP address and is verified by Digital Envoy.

| Measure                                                              | Description                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Out of Geo Filters<sup>3</sup></a>                       | <p><a href="#">Out of Geo Filters</a> show the number and percentage of evaluations from outside the designated geographic targeting area.</p> <p>The <a href="#">Out of Geo Filter Rate</a> is calculated with the following formula: <a href="#">Out of Geo Filters/Evaluations<sup>3</sup></a>.</p> |
| <a href="#">Out of Geo Incidents<sup>3</sup></a>                     | <p><a href="#">Out of Geo Incidents</a> show the number and percentage of ads served outside the designated geographic targeting area.</p> <p>The <a href="#">Out of Geo Incident Rate</a> is calculated with the following formula: <a href="#">Out of Geo Incidents/Vid Geo Active Ads</a>.</p>      |
| <a href="#">Out of Geo Blocks<sup>3</sup></a>                        | <p><a href="#">Out of Geo Blocks</a> show the number and percentage of blocks for requests from outside the designated geographic targeting area.</p> <p>The <a href="#">Out of Geo Block Rate</a> is calculated with the following formula: <a href="#">Out of Geo Filters/Requests</a>.</p>          |
| <a href="#">Unmeasurable due to Non-consent Ads<sup>3</sup></a>      | <p>The sum of <a href="#">Monitored Ads</a> that are unmeasurable for Geo due to user non-consent.</p> <p>This metric relates to <a href="#">Monitoring</a> services.</p>                                                                                                                              |
| <a href="#">Unmeasurable due to Non-consent Requests<sup>3</sup></a> | <p>The sum of requests that are unmeasurable for Geo due to user non-consent.</p> <p>This metric relates to <a href="#">Blocking</a> services.</p>                                                                                                                                                     |

## Targeting and delivery

DV supports geographic targeting in the following countries and regional breakouts:

| Geo Region            | Description                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delivery Country      | Over 265 countries and territories.<br><br><i>Note: This refers to where the impression was delivered or served.</i>                                                                                                                       |
| State/Region          | State/Region data in the following countries: <ul style="list-style-type: none"> <li>• USA</li> <li>• United Kingdom</li> <li>• France</li> <li>• Germany</li> <li>• Canada</li> <li>• Mexico</li> <li>• Spain</li> <li>• India</li> </ul> |
| DMA/MMA               | DMA/MMA in the following countries: <ul style="list-style-type: none"> <li>• USA</li> <li>• United Kingdom</li> <li>• France</li> <li>• Germany</li> </ul>                                                                                 |
| Zip Code <sup>3</sup> | In the US only                                                                                                                                                                                                                             |

## Market analysis

DV supports brand reporting based on a brand's Line of Business (LOB) to allow clients to isolate data per the regional markets in which they operate.

| Geo Region                | Description                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Brand Market <sup>3</sup> | <p>Over 265 countries and territories.</p> <p>Note: This refers to the country or countries where the campaign originated from, based on a brand's LOB.</p>                                                                                                                                                                                                                    |
| Brand Region <sup>3</sup> | <p>Brand data in the following regions:</p> <ul style="list-style-type: none"> <li>• NA - North America</li> <li>• EMEA – Europe, the Middle East &amp; Africa</li> <li>• LATAM – Latin America</li> <li>• APAC – Asia Pacific</li> <li>• N/A – Not Available</li> </ul> <p>Note: This refers to the region(s) where the campaign originated from, based on a brand's LOB.</p> |

## Measuring for CTV Devices

CTV media is more accessible than ever, which means advertisers are spending more advertising dollars on this environment. To meet this demand, DV has expanded our measurement to include CTV devices.

**Note: The metrics listed below are not yet accredited by the MRC when measured on CTV devices.**

DV supports monitoring and blocking the following services for CTV devices:

- Monitoring and blocking is supported for all Fraud services.
- Monitoring and blocking is supported for the following Brand Safety services:
  - Site and App Exclusion List
  - Custom/Brand content categories
  - Keyword blocking
  - App star reviews
  - App star ratings
- Monitoring and blocking is supported for all Geo Targeting services.

| Item                          | Description                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CTV Device                    | The name of the connected TV device, for example AppleTV, FireTV, Roku, etc.                                                                                                                                                                                    |
| VAST Visibility Certification | Specifications that certify impressions are confirmed to be originating from sources (devices, apps and platforms) that deliver 100% of the ad's pixels on the screen consistently.                                                                             |
| Universal App Name            | A DV-specific naming convention used to disambiguate an app across stores and within the same store. For example, the Universal App Name "tubitv" refers to all the ways this app is mentioned in various stores (e.g. Roku, Fire, Apple, Android, Xbox, etc.). |
| Extracted Bundle ID           | The bundle ID string extracted in DV's Tracking Pixel Service (e.g. roku.watchfreeflix).                                                                                                                                                                        |

## Viewing CTV data in Pinnacle

To view CTV data in Pinnacle, you can use the [CTV](#) filter in the [Device Delivery Type](#) dropdown menu, which is available throughout IQ Performance.

The metrics reported for CTV are defined in the following table.

| Measure                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Authentic Avg. Length Played % <sup>3</sup>                 | <p>The average time played out of the total video length for <b>Authentic Ads</b>, represented as a 0-100 percentage scale.</p> <p>The <b>Authentic Avg. Length Played Rate</b> is calculated with the following formula:</p> $\frac{(\text{Authentic Q1 Completed Impressions} + \text{Authentic Q2 Completed Impressions} + \text{Authentic Q3 Completed Impressions} + \text{Authentic Completed Impressions})}{(\text{Authentic Quartile Completion Measured Impressions}^2 \times 4)}$                                                                                                               |
| Fully On-Screen Avg. Length Played % <sup>3</sup>           | <p>The average time played out of the total video length for which the creative was fully within the visible portion of the browser, represented as a 0-100 percentage scale.</p> <p>The <b>Fully On-Screen Avg. Length Played Rate</b> is calculated with the following formula:</p> $\frac{(\text{Q1 Fully On-Screen Impressions} + \text{Q2 Fully On-Screen Impressions} + \text{Q3 Fully On-Screen Impressions} + \text{Q4 Fully On-Screen Impressions})}{(\text{Fully On-Screen Measured Impressions} \times 4)}$                                                                                    |
| Authentic Fully On-Screen Avg. Length Played % <sup>3</sup> | <p>The average time played out of the total video length for <b>Authentic Ads</b> where the creative was fully within the visible portion of the browser, represented as a 0-100 percentage scale.</p> <p>The <b>Authentic Fully On-Screen Avg. Length Played Rate</b> is calculated with the following formula:</p> $\frac{(\text{Authentic Q1 Fully On-Screen Impressions} + \text{Authentic Q2 Fully On-Screen Impressions} + \text{Authentic Q3 Fully On-Screen Impressions} + \text{Authentic Q4 Fully On-Screen Impressions})}{(\text{Authentic Fully On-Screen Measured Impressions}^2 \times 4)}$ |

| Measure                            | Description                                                                                                                                                  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Continuous Play Calls <sup>3</sup> | The count of ad calls within an OTT configuration that play the next episode in a series or related content automatically after the end of previous content. |
| Timed Out Calls <sup>3</sup>       | The count of ad calls generated by user sessions that were determined to be inactive.                                                                        |

## IVT Disclosures

The MRC and IAB have established industry-wide invalid traffic measurement guidelines to address the rise in invalid traffic by increasing transparency, providing standard definitions for each type of invalid traffic, improving measurement and reducing discrepancies among vendors.

The IQ Performance IVT Disclosures dashboard displays total impression counts and then the counts with pre-rendered impressions and general and sophisticated invalid traffic removed to ensure that DV counts align with the industry guidelines.

Along with the dashboard, there are two reports:

- The Gross Metrics
- The GIVT Details

The IVT Disclosures tab and Gross Metrics Report, which is a placement-level report showing total impressions and breakouts for invalid traffic, report the following metrics:

| Measure                         | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Total Impressions <sup>3</sup>  | The total count of served impressions including pre-rendered, GIVT, Fraud/ SIVT and valid impressions.                                                                                                                                                                                                                                                                                          |
| Pre-rendered Calls <sup>3</sup> | All served but not rendered impressions. A pre-rendered call occurs when a call has been downloaded, but the creative has not been displayed, for example, when pages are pre-cached but never displayed. Because the impression never has the opportunity to be seen, it is never included in counts as a valid impression.<br><br>Pre-rendered calls are removed from the counts that follow. |
| Gross Impressions               | All rendered and served impressions before GIVT is removed. The count of impressions including those categorized as general invalid traffic, sophisticated invalid traffic and valid impressions.                                                                                                                                                                                               |
| GIVT Impressions                | A total, deduplicated count of impressions identified as general invalid traffic. General invalid traffic is identified by using standardized, industry-wide lists that are shared across vendors, such as the IAB list of known bots and spiders and unknown browsers.                                                                                                                         |

| Measure                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Net Impressions                        | A count of impressions where <a href="#">GIVT Impressions</a> have been removed. This metric also represents the <a href="#">Monitored Impression</a> counts found in all other reports.                                                                                                                                                                                                                                                                                                                                          |
| Total Net Impressions                  | A count of impressions on only valid traffic, i.e., <a href="#">Gross Impressions</a> with all types of invalid ( <a href="#">GIVT and Fraud/SIVT Impressions</a> <sup>3</sup> ) traffic removed.                                                                                                                                                                                                                                                                                                                                 |
| Net Viewable Impressions               | <p>Impressions across desktop, mobile web, and in-app delivery that were measurable for viewability, reached the IAB viewability guidelines (at least 50% of the creative was in the viewable portion of a user's device for one consecutive second or more), were valid traffic impressions, i.e., <a href="#">Gross Impressions</a> with general invalid traffic removed.</p> <p>The <a href="#">Net Viewable Rate</a> is calculated with the following formula: <a href="#">Viewable Impressions/Measured Impressions</a>.</p> |
| Net Non-Viewable Impressions           | Impressions across desktop, mobile web, and in-app delivery that were measurable for viewability but did not reach the IAB viewability guidelines (at least 50% of the creative was in the viewable portion of a user's device for one consecutive second or more) and were valid traffic impressions, i.e., <a href="#">Gross Impressions</a> with general invalid traffic removed.                                                                                                                                              |
| Net Unmeasured Impressions             | A count of <a href="#">Eligible Impressions</a> where serving scenarios prevented the successful measurement of the impression and therefore measurement did not take place.                                                                                                                                                                                                                                                                                                                                                      |
| Fraud/SIVT Impressions <sup>3</sup>    | <p>A deduplicated count of all types of fraud and sophisticated invalid traffic, which includes site fraud, bot fraud, nonhuman data center traffic and injected ads.</p> <p>See <a href="#">Fraud/SIVT</a> for more information about these metrics.</p>                                                                                                                                                                                                                                                                         |
| Tracked Ads <sup>3</sup>               | The count of all served ad calls including pre-rendered, <a href="#">GIVT</a> , <a href="#">Fraud/SIVT</a> and valid impressions.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Render Unknown Ads <sup>3</sup>        | The count of ad calls for which it cannot be determined whether an ad was rendered.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Begin to Render (BTR) Ads <sup>3</sup> | The count of all ad calls for which the ad began to render.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

The GIVT Details report includes the counts for pre-rendered calls and GIVT impressions and an additional breakout of GIVT metrics, as described in the following table.

| Measure                         | Description                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Known Bots/Spiders <sup>3</sup> | A count of impressions requested by bots or spiders on the IAB Known Bots and Spiders list, which represent traffic from nonhuman sources that identify themselves as robots, generally for purposes like indexing sites. |
| Unknown Browser <sup>3</sup>    | A count of impressions served to unknown or unidentifiable browsers, as identified by the IAB.                                                                                                                            |
| Other <sup>3</sup>              | An aggregated count of impressions originating from DV internal IP addresses, the internal IP addresses of creative-auditing companies and other forms of traffic found through standardized filtration methodologies.    |

## Benchmarks<sup>3</sup>

DV has leveraged our rigorous, best-in-class quality control and measurement accuracy into our Benchmark methodology, allowing advertisers and agency buyers to assess their verification metrics in comparison to the general traffic captured across DV's entire network.

DV Benchmarks are calculated using aggregated and anonymized performance data from impressions served for brands utilizing DV measurement services, including Viewability, Brand Safety, Fraud, Out of Geo and Blocking.

In IQ Performance, the DV Benchmarks Advanced performance view allows users to compare their performance against benchmarked data across display & video and buying channels. Within this dashboard, filter sections give users the flexibility to align any subset of their data with benchmarks of their choice. Users can apply filters to their own data (*My Results Only*), to benchmark data (*Benchmarks Only*) or to both (*Benchmarks & My Results*). Filter sections also provides additional dimensions including date, media type, brand region and industry vertical, which compares a user's project benchmark data to specific industries, to further filter data.

### Benchmark Calculation

Benchmark data is generated monthly against all DV traffic; the same data loaded across all programs. To ensure the stability and diversity of the benchmark data, the following criteria is used to determine if the benchmark can be generated:

- A minimum number of impressions
- A minimum number of advertisers
- A maximum percentage of impressions belonging to a single advertiser

### Report views

Report views are divided into three distinct sections:

- **My Results** - This rate is calculated based on the client's data within a project, according to the selection criteria applied to the dashboard via the *My Results Only* and *Benchmarks & My Results* benchmark filters.

- **Overall Benchmark** - This rate is calculated based on the benchmark data according to the selection criteria applied to the dashboard via the *Benchmarks Only* and *Benchmarks & My Results* filter sections. This calculation shows the overall rate and does not take into account all traffic.
- **Buying Channel** - These rates are calculated using the same set of data as the *Overall Benchmark*, divided by buying channel. This calculation provides clients with further insight into how different buying techniques may affect performance results.

## Buying channels

| Item                    | Description                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Real-Time Bidding (RTB) | Real time purchasing of media via an auction, programmatic, or tech platform including SSP, DSP and RTB Exchange.                                                             |
| Publisher               | A web publication that allows advertisers to purchase ad space directly on their property.                                                                                    |
| Network                 | A pool of inventory from an established set of publisher properties that allows advertiser to increase their reach while still targeting a general audience and/or site list. |
| Mixed/Other             | Any buying channel that does not fall into the above categories.                                                                                                              |

## Performance metrics

The performance metrics reported for each report view are defined in the following table.

| Measure                            | Description                                                                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Monitored Ads <sup>3</sup>         | The total count of ads served where the DV Monitoring services were applied.                                                                                                                                                   |
| Display Ads <sup>3</sup>           | Display ads across desktop, mobile web and mobile in-app delivery that were measured as viewable according to the IAB viewability guideline.                                                                                   |
| Video Ads <sup>3</sup>             | Video ads across desktop, mobile web and mobile in-app delivery that were measured as viewable according to the IAB viewability guideline.                                                                                     |
| Requests <sup>3</sup>              | The count of requests received by the blocking tag when the Blocking service is used.                                                                                                                                          |
| Display Viewable Rate <sup>3</sup> | Percentage of <b>Display Measured Impressions</b> identified as viewable.<br><br>The <b>Display Viewable Rate</b> is calculated with the following formula: <b>Display Viewable Impressions/Display Measured Impressions</b> . |

| Measure                                      | Description                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Video Viewable Rate <sup>3</sup>             | <p>Percentage of Video Measured Impressions across desktop, mobile web and mobile in-app delivery that were measured as viewable according to the IAB viewability guidelines.</p> <p>The Video Viewable Rate is calculated with the following formula: <math>\text{Video Viewable Impressions} / \text{Video Measured Impressions}</math>.</p> |
| Authentic Rate <sup>3</sup>                  | <p>Percentage of Measured Impressions that met the criteria for Authentic Ads.</p> <p>The Authentic Rate is calculated with the following formula: <math>\text{Authentic Ads} / \text{Monitored Ads}</math>.</p>                                                                                                                               |
| Authentic Display Viewable Rate <sup>3</sup> | <p>Percentage of Display Measured Impressions that are identified as Authentic and also met the IAB standard for video viewability.</p> <p>The Authentic Video Viewable Rate is calculated with the following formula: <math>\text{Authentic Display Viewable Impressions} / \text{Display Measured Impressions}</math>.</p>                   |
| Authentic Video Viewable Rate <sup>3</sup>   | <p>Percentage of Video Measured Impressions that are identified as Authentic and also met the IAB standard for video viewability.</p> <p>The Authentic Video Viewable Rate is calculated with the following formula: <math>\text{Authentic Video Viewable Impressions} / \text{Video Measured Impressions}</math>.</p>                         |
| Block Rate <sup>3</sup>                      | <p>Percentage of blocking requests when the Blocking service is used.</p> <p>The Block Rate is calculated with the following formula: <math>\text{Blocks} / \text{Requests}</math>.</p>                                                                                                                                                        |
| Brand Safety Incident Rate <sup>3</sup>      | <p>Percentage of Monitored Ads that had a Brand Safety incident.</p> <p>The Brand Safety Incident Rate is calculated with the following formula: <math>(\text{Brand Safety Incidents} + \text{Brand Safety Blocks}) / (\text{Monitored Ads} + \text{All Blocks})</math>.</p>                                                                   |
| Fraud/SIVT Rate <sup>3</sup>                 | <p>Percentage of Monitored Ads with any form of Fraud or SIVT incidents.</p> <p>The Fraud/SIVT Rate is calculated with the following formula: <math>(\text{Fraud/SIVT Incidents and Brand Safety Blocks}) / (\text{Monitored Ads} + \text{All Blocks})</math>.</p>                                                                             |
| Out of Geo Rate <sup>3</sup>                 | <p>Percentage of ads served outside the targeted geographic areas.</p> <p>The Out of Geo Rate is calculated with the following formula: <math>(\text{Out of Geo Incidents} + \text{Brand Safety Blocks}) / (\text{Monitored Ads} + \text{All Blocks})</math>.</p>                                                                              |

## Geo benchmarks<sup>3</sup>

DV's Geo Benchmarks provide advertisers with the ability to compare their campaign performance stats against those of other advertisers within the same geographic area. Using the DV Benchmarks Advanced performance view in IQ Performance, users can now filter their benchmark data per Brand Market and Brand Region.

Geo Benchmark data is supported in markets where DV has significant presence to generate a stable benchmark.

---

## Endnotes

<sup>1</sup> This formula applies only to campaigns using at least one of the following services: Brand Safety, IQ Fraud Advanced or Geo Targeting. If not all campaigns are using these services, you may see discrepancies between rates calculated manually and the rates on the Summary view.

<sup>2</sup> This formula applies to only campaigns using viewability and one of the following services: Brand Safety, Fraud Advanced, Viewability Advanced or Geo Targeting. If not all campaigns are using these services, you may see discrepancies among rates calculated and the rates on the Summary view.

<sup>3</sup> These metrics and methodology have not yet been accredited by the Media Rating Council (MRC). DoubleVerify undergoes thorough annual audits to review and re-accredit its MRC-accredited technologies. Methodologies and metrics released after the annual audit undergo informal discussions with the auditors to ensure they follow best practices and guidelines established by the IAB and MRC, but are not fully accredited until the next audit.
